TRAM doesn't appear to support higher dimensional chare arrays

Description

Some digging suggests that TRAM tries to invoke CkLocMgr::updateLocation with 2 parameters, whereas the version that it seems to be intended to reference has 3 parameters. There is an overload that takes 2 parameters, but it takes an integer rather than a CkArrayIndex parameter (so the issue is masked for 1D chare arrays). However, this might be concealing other issues.
